

Create logins in seconds, right in Telegram

Solutions Assistant creates the MaxPlayer login in your panel and hands you the message ready for the customer.

This page: <https://ajuda.solutionsapp.site/en/telegram-assistant/>

Open Solutions Assistant

1

Open the bot, tap **Start** and choose your language flag.

2

Create the [API key](#) and paste it into the bot. It deletes the message with the key right away.

3

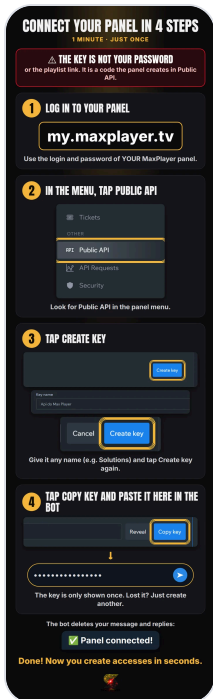

Send the **customer's name** and the **list link**. The link's DNS must be added in [Domains](#).

4

Check and tap  **Create**.

5

Tap  **Copy message** and send it to the customer. Done.

With **DNS 1 and DNS 2 in the same group** ([see how](#)), the bot puts both in the same login: if one freezes, the customer switches.

Use the bot only in a private chat. Your panel password **never** goes through the bot: it only uses the key.
